Car2X "Pull" Applikationen
Carmina Antrag 2008

Mensch-Maschine Schnittstelle (HMI) für Car2X Applikationen

The sim^{TD} HMI for weather hazard warning.

Cross Traffic Assistant.

Location dependent services.

- We are a leading research group in the area of design, development, and test of HMI solutions for cooperative vehicles.
- For example, we developed the HMI solution for the large-scale field test sim^{TD} (www.simtd.de) and will continue this development in the project Converge.
- The HMI visually and acoustically indicates information and warnings to the driver. It also receives input from the driver to trigger functions. The HMI is a central sim^{TD} system component, whose functionality has been tested and verified extensively prior to of the field test during multi-stage tests in the laboratory.
- The HMI was designed to incorporate non-technical user-friendliness criteria. These criteria were tested during an iterative process.

HMI Design, Entwicklung und Test

PhD topic: *Beyond the „Push“-Paradigm: Enhanced forms of Information Access and Novel Application Areas for Vehicle-2X Communication Networks*

Driver

2011

Sandro Castronovo

Presentation / Interaction

- The usage of which modalities is suitable in a specific driving context?
- What is the effect on driver distraction considering the current cognitive load?
- How can different modalities be integrated into the framework?
- What novel modalities are feasible (eye gaze, gestures, etc.)?

Novel Applications

- What pull applications are possible considering the specific limitations of V2X?
- Which of them comprise an additional benefit and are accepted by the driver?
- What is the applications' effect on safety?

Framework

- How can pull applications and novel modalities be integrated in a well defined framework?
- What requirements exist to this framework in the driving context?
- How can existent ADAS and IVIS be integrated?

Simulation

- Are existent simulation tools applicable to integrate and evaluate pull applications?
- How can they be applied to proposed pull paradigm?

Network

- Are today's protocols applicable to proposed pull paradigm?
- Where is enhancement of these protocols necessary

Winning DFKI researchers: Internet access from the car enabled by a glance!

Wednesday, 22. August 2012

Three employees of the DFKI were awarded on the major international conference on "Intelligent Environments 2012", Mexico (27th-28.06. 2012), with the "Best Video / Demo Award". The winning paper describes a novel way of personalized interaction between occupants and the environment, and the infotainment system of the vehicle.

The publication "Personalized In-Vehicle Information Systems: Building an Application Infrastructure for Smart Cars in Smart Spaces" of DFKI researchers Mohammad Mehdi Moniri, Dr. Christian Müller and Dr. Michael Field (technical realization of the video: Renato Orsini) describes the interaction passengers in a vehicle perform with its external environment. The occupants of the car for example have the opportunity to get information on buildings and other visible objects around them while driving. For this interaction, it is sufficient to look through the window at the target object and formulate a question like "What is this building?" or "Give

Eyebox: Multimodale Referenzauflösung für raumbezogene Interaktion im städtischen Umfeld

Multimodale Interaktion

Kombination von Texteingabe per Sprache und Multimodaler Korrektur

1) Searching /
Composing text

2) Error correction

3) Modes

4) Driver distraction

5) Task-oriented quality
measures

Description

initial input error (blue bars) and interaction steps needed (red bars) depending on search / input method.

reduction of the error (blue bars) and additional interaction steps (red bars) via different correction strategies.

driver distraction caused by different interaction modalities (colors) as a function of the number of interaction steps (x-axis).

acceptable level of driver distraction depending on the driving situation (traffic, difficulty of track, speed, time of the day, ...) and the initial cognitive workload.

acceptable error rate depending on the communicative goal and message context.

Empirical Paradigm

corpus studies using available speech / text corpora or purpose-built corpora on the target domain.

data driven evaluation using separate development and evaluation sets

driving experiments investigating the relationship between modalities (or combinations of modalities) and driver distraction

available standards and driving experiments investigating the relationship between driver distraction and driving performance.

corpus studies using available text corpora or purpose-built corpora on the target domain.

Challenges

possible lack of realistic constraints with respect to context (driving), variability (voice, emotions, time of the day), and nuisance attributes (background noise, cross-talk, light conditions, vibrations,...)

sufficient generalization may not be possible because correction mechanisms are likely to be domain-specific

regarding the driver distraction as of function of interaction steps is a simplifying assumption and can at only be used as an approximation.

empirically, driver distraction is in alia investigated on the basis of driving performance (simulated driving task). Estimation of severity / consequences of failures with respect to real driving is complex.

word error rate (WER) may not be a suitable error measure or is at least not ideal. Rather than that, a differentiated error measure should be developed.

Connected Driving: Multimodal Texting Dialogs

We furthermore investigated multiple modalities and respective dialog concepts for post ASR error correction:

- central rotary device (turn-and-push dial)
- speech
- touch-screen
- eye tracking

We were one of the first research groups to investigate explicit gaze-based interaction in the car.

(ASR = Automatic Speech Recognition):

Ziele

Intelligent Mobility & Transportation Systems

1. Set-up test sites and create concrete new services and product offerings for large companies and SMEs.
2. Leverage and coordinate innovation in the field in order to have maximum impact on societal challenges.
3. Issue regular and open challenges (organized by the KIC) in order to foster innovation that is well-directed according to 1 and 2

Gesellschaftliche Herausforderungen

Safe Mobility	• Mainly Car2X related products and services as well as tools for development and research • Challenge: “Protection of vulnerable road users”
Sustainable Mobility	• Products and services related to the market launch of electric vehicles, car-sharing concepts as well as intermodal mobility • Challenge: “ICT innovation with the highest individual impact on CO2 reduction”
Autonomous Mobility	• Technology implementing concrete steps on the transition from completely human-operated cars to fully autonomous cars\ • Challenge: “Systems that are able to perform manoeuver X” (X= overtaking, filtering into another lane, entering or exiting motorway, etc.)
Socially Enriched Mobility	• Products and services related to create compelling new features for products of the automotive industry • Challenge: “ICT innovation leading to more empathy on the roads”
Accessible Mobility	• Mainly platforms and services for efficient intermodal mobility • Challenge: “Find the system that creates the most efficient journey in one of the large KIC-cities.”

Mensch-Fahrzeug-Kooperation: Die Pferd-Methapher

direkte Kontrolle

Kommunikation

- Zwei intelligente Systeme kollaborieren miteinander
- Vertrauen, Teilen von Verantwortung, das richtige Feedback

Wie die Pferd-Methapher unser Denken leitet

Was könnten die Zügel sein?

Wie sollte die Kommunikation stattfinden?

Gegen die Wand laufen oder nicht ?

Welche Art von Feedback ist richtig ?

Was ist mit dem „ohnmächtigen Reiter“?

Zorros Pferd stand bei Bedarf immer bereit oder kam auf ein Pfeifsignal angerannt

Verhalten ?
Vertrauen ?

Verhaltenseffekte von Fahrerassistenzsystemen

■ ADAS benefits are potentially very large because they may considerably contribute to decreasing human suffering, economical cost and pollution.

■ However, as many researchers argue, in assessing the benefits of ADAS it has to be taken into account that any gains in terms of security may be again reduced by the fact they affect the drivers' behavior

Wickens: False Alarms / Misses

- Wickens: an increase in **automation false alarms** decreases the operator's *compliance* resulting in longer response time to / disregard of alerts

- An increasing automation's **miss rate**, on the other hand side, leads to a reduction of *reliance* and to closer examination of raw data in order to better avoid missing anything.

→ Conversely, if during a longer period of time only a marginal percentage of misses is occurring, the driver might excessively trust the warning system and be less conscientious when checking the raw data or even rely completely on the system.

A Concrete Study

■ Claim:

- In assessing the benefits of Advanced Driver Assistance Systems (ADAS) it has to be taken into account that any gains in terms of safety may be again reduced by the fact they affect the drivers' behavior.

■ Supporting Results

- The drivers' ability to effectively react to suddenly appearing obstacles when a warning system fails is significantly lower than before they got used to it..
- At the same time, the stress level is significantly higher.

Angela Mahr, Yujia Cao, Mariet Theune, Veronika Dimitrova-Krause, Tim Schwartz, Christian Müller (2010): What if it Suddenly Fails? Behavioral Aspects of Advanced Driver Assistant Systems on the Example of Local Danger Alerts . In Proceedings of 19th European Conference on Artificial Intelligence (ECAI 2010).

Results

- The findings reported here give rise questions on the roll-out strategy for fully autonomous cars, either into large-scale field test or into practice.
- The technology is susceptible for behavioral impacts such as attentional decrease/shift and transition problems in combination with over-reliance.
- According to our results, the behavioral effects have to be taken into account. Engineers should make sure that the drivers are always aware of the fact that the system may fail.

Fazit

- Die Automotive-Domäne birgt eine Reihe von Herausforderung für IKT, im speziellen Intelligente Benutzerschnittstellen.
 - Dies gilt nicht nur für den Themenbereich autonomes Fahren, sondern auch für nachhaltige Mobilität und effiziente Mobilität.
 - Wir haben die Werkzeuge und das Know-How, um auch zukünftig wesentliche Beiträge zu leisten.
 - Eine weitestgehende Verzahnung mit der EIT ICT Labs Action Line IMS ermöglicht eine größtmögliche Bedeutung/Wirkung für automotive@dfki.
-
